Introduction to Aerial Robotics Lecture 2

Shaojie Shen
Associate Professor
Dept. of ECE, HKUST

11 February 2025

Outline

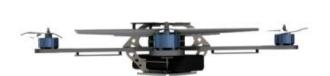

- Rigid Body Transformations
- Rotational Motions
- Rotation Representations
- Rigid Body Motions
- Rigid Body Velocities
- Quadrotor Dynamics

Rigid Body Transformations

Rigid Body

- Two distinct positions and orientations of the same rigid body
 - Let **p** and **q** be two points on a rigid body

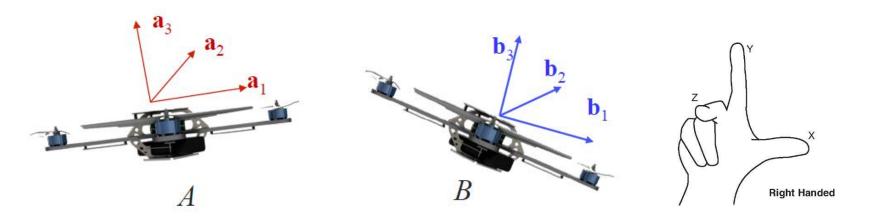

$$- \| \mathbf{p}(t) - \mathbf{q}(t) \| = \| \mathbf{p}(0) - \mathbf{q}(0) \| = \text{constant}$$

Reference Frames

- We associate any position and orientation with a reference frame
 - We use right-handed coordinate frames
 - We can find three linearly independent vectors \mathbf{a}_1 , \mathbf{a}_2 , \mathbf{a}_3 that are basis vectors for reference frame A
 - We can write any vector as a linear combination of basis vectors in either frame $v = v_1 a_1 + v_2 a_2 + v_3 a_3$

Notation

- Vectors
 - -x, y, a, ...

- Matrices
 - -A, B, C, ...

- Reference frames
 - -A, B, C, ...
 - a, b, c, ...

- Transformations
 - $-A\mathbf{A}_B$, $A\mathbf{R}_B$...
 - $-\mathbf{A}_{ab}$, \mathbf{R}_{ab} ...
 - $-g_{ab}(.)$, $h_{ab}(.)$...

Be Aware of Potential Confusion!!!

Rigid Body Displacement

• Object:

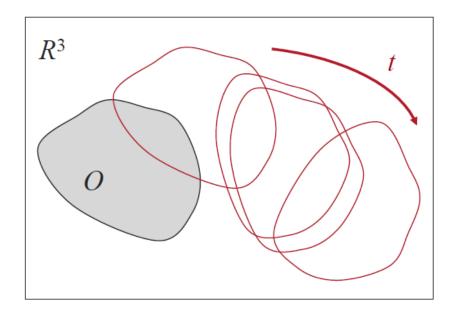

$$0 \in \mathbb{R}^3$$

- Rigid body displacement
 - Map

$$g: O \longrightarrow \mathbb{R}^3$$

- Rigid body motion
 - Continuous family of maps

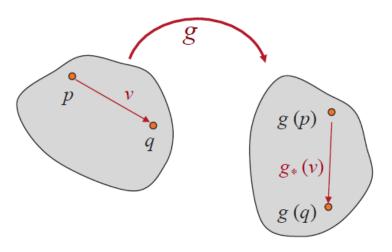

$$g(t): O \to \mathbb{R}^3$$

Rigid Body Displacement

- A displacement of a transformation of points
 - Transformation (g) of points induces an action (g*) on vectors

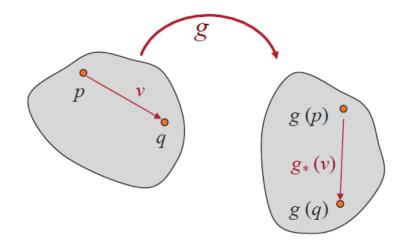

$$g_*(\mathbf{v}) = g(\mathbf{q}) - g(\mathbf{p})$$

Definition of Rigid Body Displacement

Lengths are preserved

$$\|g(\mathbf{q}) - g(\mathbf{p})\| = \|\mathbf{q} - \mathbf{p}\|$$

Cross products are preserved

$$g_*(\mathbf{v}) \times g_*(\mathbf{w}) = g_*(\mathbf{v} \times \mathbf{w})$$

Why?

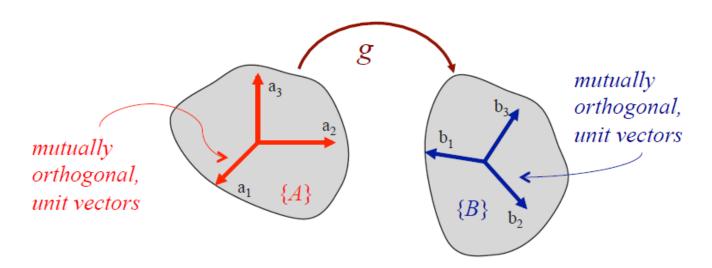

Eliminate internal reflection: $(x, y, z) \rightarrow (x, y, -z)$

Properties of Rigid Body Displacement

Inner products are also preserved

$$g_*(\mathbf{v}) \cdot g_*(\mathbf{w}) = \mathbf{v} \cdot \mathbf{w}$$

Orthogonal vectors are mapped to orthogonal vectors

Rigid Body Displacement

- Rigid body displacements are transformations that satisfy two important properties:
 - 1. Lengths are preserved
 - 2. Cross products are preserved
- Rigid body transformations and rigid body displacements are often used interchangeably
 - Transformations generally used to describe relationship between reference frames attached to different rigid bodies.
 - Displacements describe relationships between two positions and orientation of a frame attached to a displaced rigid body

Rotational Motions

Rotation

- Coordinate frames are right-handed
- Principle axes of frame A:

$$-\mathbf{x} = [1\ 0\ 0]^T$$

$$-\mathbf{y} = [0\ 1\ 0]^T$$

$$-\mathbf{z} = [0\ 0\ 1]^T$$

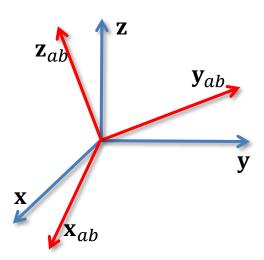

• Principle axes of frame *B*:

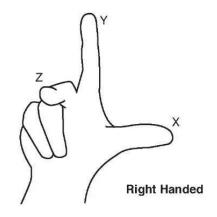

$$-\mathbf{x}_{ab},\mathbf{y}_{ab},\mathbf{z}_{ab}\subset\mathbb{R}^3$$

• The Rotation Matrix:

$$-\mathbf{R}_{ab} = [\mathbf{x}_{ab}, \mathbf{y}_{ab}, \mathbf{z}_{ab}]$$

Coordinates of principle axes of B related to A

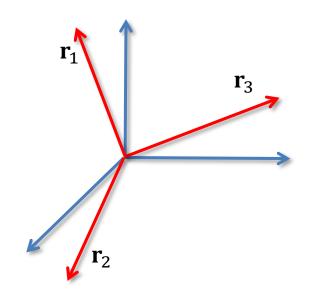

Properties of a Rotation Matrix

- Let $\mathbf{R} = [\mathbf{r}_1, \mathbf{r}_2, \mathbf{r}_3]$ be a rotation matrix
- Orthogonal:

$$-\mathbf{r}_{i}^{T} \cdot \mathbf{r}_{j} = \begin{cases} 0 \text{ if } i \neq j \\ 1 \text{ if } i = j \end{cases}$$
$$-\mathbf{R} \cdot \mathbf{R}^{T} = \mathbf{I}$$

$$-\det \mathbf{R} = \mathbf{r}_1^T \cdot (\mathbf{r}_2 \times \mathbf{r}_3) = \mathbf{r}_1^T \cdot \mathbf{r}_1 = 1$$

- The set of all rotations forms the Special Orthogonal Group
 - Special orthogonal group
 - 3D rotations: SO(3)
 - 2D rotations: SO(2)
 - $-SO(n) = {\mathbf{R} \in \mathbb{R}^{n \times n} | \mathbf{R} \cdot \mathbf{R}^T = \mathbf{I}, \det \mathbf{R} = 1}$

Properties of a Rotation Matrix

- $SO(3) = {\mathbf{R} \in \mathbb{R}^{3 \times 3} | \mathbf{R} \cdot \mathbf{R}^T = \mathbf{I}, \det \mathbf{R} = 1}$
- SO(3) is a group under the operation of matrix multiplication
 - 1. Closure: If \mathbf{R}_1 , $\mathbf{R}_2 \in SO(3)$, then $\mathbf{R}_1 \cdot \mathbf{R}_2 \in SO(3)$
 - 2. Identity: The identity matrix is the identity element
 - 3. Inverse: If $\mathbf{R} \in SO(3)$, then $\mathbf{R}^{-1} \in SO(3)$
 - 4. Associativity: $\mathbf{R}_1 \cdot (\mathbf{R}_2 \cdot \mathbf{R}_3) = (\mathbf{R}_1 \cdot \mathbf{R}_2) \cdot \mathbf{R}_3$

(G,\cdot) is a group if:

- 1) $g_1, g_2 \in G \Rightarrow g_1 \cdot g_2 \in G$
- 2) $\exists ! e \in G$, s.t. $g \cdot e = e \cdot g = g$, $\forall g \in G$
- 3) $\forall g \in G, \exists ! g^{-1} \in G, s.t. g \cdot g^{-1} = g^{-1} \cdot g = e$
- 4) $g_1 \cdot (g_2 \cdot g_3) = (g_1 \cdot g_2) \cdot g_3$

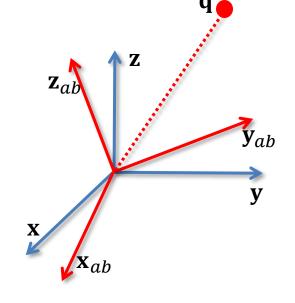

Group examples:

- 1. The set of all integers with addition operation
- 2. The set of all real numbers with arithmetic operations

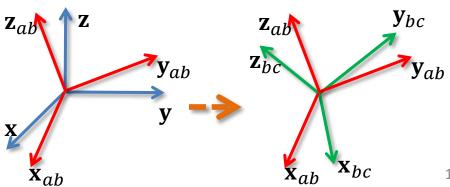

Properties of a Rotation Matrix

- A transformation that rotates the coordinates of a point from frame B to frame A
 - Let $\mathbf{q}_b = [x_b, y_b, z_b]^T \in \mathbb{R}^3$ be coordinate of point \mathbf{q} in frame B
 - Let \mathbf{q}_a be coordinate of point \mathbf{q} in frame A

$$-\mathbf{q}_{a} = x_{b} \cdot \mathbf{x}_{ab} + y_{b} \cdot \mathbf{y}_{ab} + z_{b} \cdot \mathbf{z}_{ab} = \begin{bmatrix} \mathbf{x}_{b} \\ \mathbf{y}_{b} \\ z_{b} \end{bmatrix} = \mathbf{R}_{ab} \cdot \mathbf{q}_{b}$$

- Composition Rule
 - $-\mathbf{R}_{ac}=\mathbf{R}_{ab}\cdot\mathbf{R}_{bc}$

Rotation is Rigid Body Transformation

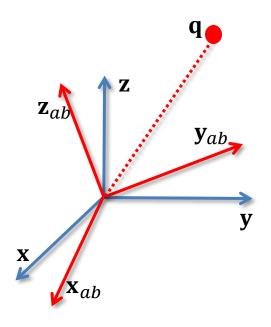

$$\mathbf{R}_{ab} = [\mathbf{x}_{ab}, \mathbf{y}_{ab}, \mathbf{z}_{ab}]$$
 preserves:

- o Length:
 - $-\|\mathbf{R}_{ab}(\mathbf{p}_b \mathbf{q}_b)\| = \|\mathbf{p}_b \mathbf{q}_b\|$
- O Cross product:
 - $\mathbf{R}_{ab}(\mathbf{v} \times \mathbf{w}) = (\mathbf{R}_{ab}\mathbf{v}) \times (\mathbf{R}_{ab}\mathbf{w})$

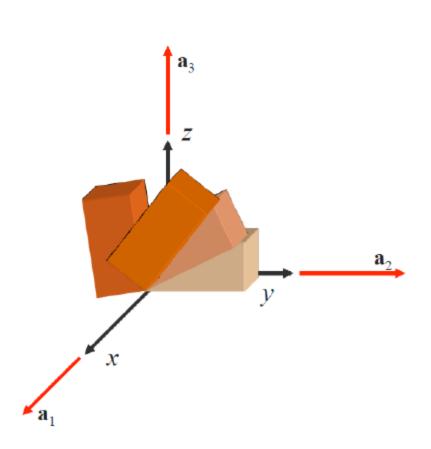

matrix, and $\mathbf{a} \times \mathbf{b} = (\mathbf{a})^{\hat{}} \mathbf{b}$

- Use the fact $\mathbf{R}(\mathbf{v})^{\hat{}}\mathbf{R}^{T} = (\mathbf{R}\mathbf{v})^{\hat{}}$ to prove, where

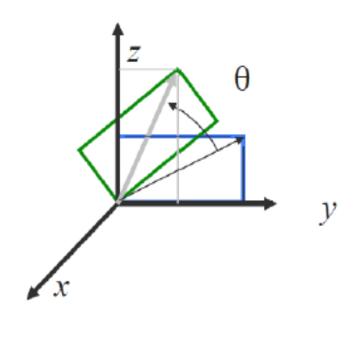

$$(\mathbf{a})^{\hat{}} = \begin{bmatrix} 0 & -a_3 & a_2 \\ a_3 & 0 & -a_1 \\ -a_2 & a_1 & 0 \end{bmatrix}$$
 is the skew-symmetric

Example - Rotation

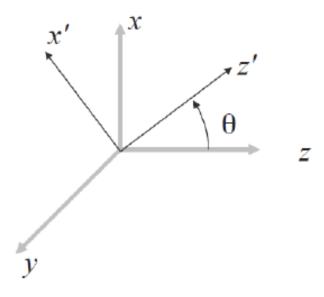

$$\mathbf{R}_{\mathbf{x}}(\theta) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos\theta & -\sin\theta \\ 0 & \sin\theta & \cos\theta \end{bmatrix}$$

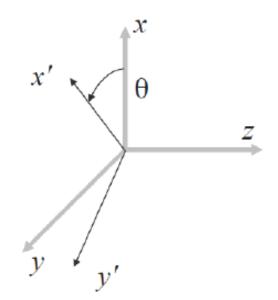

Example - Rotation

$$\mathbf{R}_{\mathbf{y}}(\theta) = \begin{bmatrix} \cos\theta & 0 & \sin\theta \\ 0 & 1 & 0 \\ -\sin\theta & 0 & \cos\theta \end{bmatrix}$$

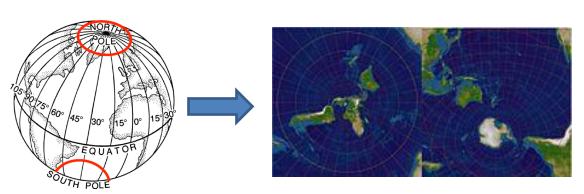

$$\mathbf{R}_{\mathbf{z}}(\theta) = \begin{bmatrix} \cos\theta & -\sin\theta & 0\\ \sin\theta & \cos\theta & 0\\ 0 & 0 & 1 \end{bmatrix}$$

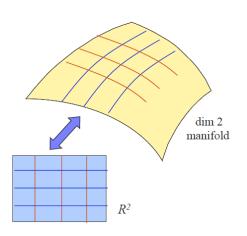

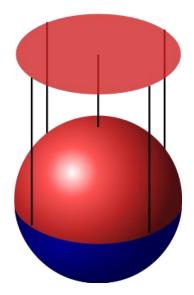

Properties of Rotation

- SO(3) is a continuous group
 - The multiplication operation is a continuous operation
 - The inverse is a continuous function
- SO(3) is a smooth manifold
 - A manifold of dimension n is a set M which is locally resembled to Euclidean space \mathbb{R}^n near each point
 - Example: sphere is a differentiable manifold that is locally resembled to \mathbb{R}^2

Rotation Representations

Rotation Representations

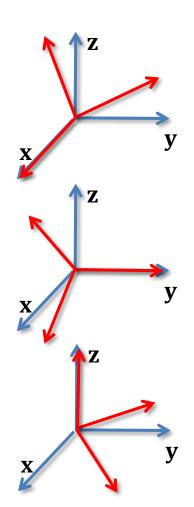

- Rotation matrices
- Euler angles
- Exponential coordinates
- Quaternions
 - Will be discussed later in the semester
 - Slides are provided as appendix for this lecture

• Elementary rotations:

$$-\mathbf{R}_{x}(\phi) = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos\phi & -\sin\phi \\ 0 & \sin\phi & \cos\phi \end{bmatrix}$$

$$-\mathbf{R}_{y}(\theta) = \begin{bmatrix} \cos\theta & 0 & \sin\theta \\ 0 & 1 & 0 \\ -\sin\theta & 0 & \cos\theta \end{bmatrix}$$

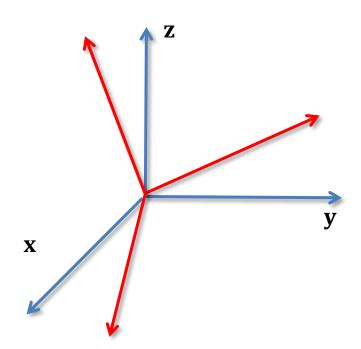

$$- \mathbf{R}_{z}(\psi) = \begin{bmatrix} \cos \psi & -\sin \psi & 0\\ \sin \psi & \cos \psi & 0\\ 0 & 0 & 1 \end{bmatrix}$$

- Any rotation can be described by three successive rotations about linear independent axes
- However, this is an almost 1-1 transform with singularities:

$$- R_{z}(\psi) \cdot R_{x}(\phi) \cdot R_{y}(\theta) \Rightarrow R$$

$$- R_{z}(\psi) \cdot R_{x}(\phi) \cdot R_{y}(\theta) \notin R$$

• Different Euler angle conversions:

Proper Euler angles	Tait-Bryan angles
$X_1 Z_2 X_3 = \begin{bmatrix} c_2 & -c_3 s_2 & s_2 s_3 \\ c_1 s_2 & c_1 c_2 c_3 - s_1 s_3 & -c_3 s_1 - c_1 c_2 s_3 \\ s_1 s_2 & c_1 s_3 + c_2 c_3 s_1 & c_1 c_3 - c_2 s_1 s_3 \end{bmatrix}$	$X_1 Z_2 Y_3 = \begin{bmatrix} c_2 c_3 & -s_2 & c_2 s_3 \\ s_1 s_3 + c_1 c_3 s_2 & c_1 c_2 & c_1 s_2 s_3 - c_3 s_1 \\ c_3 s_1 s_2 - c_1 s_3 & c_2 s_1 & c_1 c_3 + s_1 s_2 s_3 \end{bmatrix}$
$X_1 Y_2 X_3 = \begin{bmatrix} c_2 & s_2 s_3 & c_3 s_2 \\ s_1 s_2 & c_1 c_3 - c_2 s_1 s_3 & -c_1 s_3 - c_2 c_3 s_1 \\ -c_1 s_2 & c_3 s_1 + c_1 c_2 s_3 & c_1 c_2 c_3 - s_1 s_3 \end{bmatrix}$	$X_1 Y_2 Z_3 = \begin{bmatrix} c_2 c_3 & -c_2 s_3 & s_2 \\ c_1 s_3 + c_3 s_1 s_2 & c_1 c_3 - s_1 s_2 s_3 & -c_2 s_1 \\ s_1 s_3 - c_1 c_3 s_2 & c_3 s_1 + c_1 s_2 s_3 & c_1 c_2 \end{bmatrix}$
$Y_1 X_2 Y_3 = \begin{bmatrix} c_1 c_3 - c_2 s_1 s_3 & s_1 s_2 & c_1 s_3 + c_2 c_3 s_1 \\ s_2 s_3 & c_2 & -c_3 s_2 \\ -c_3 s_1 - c_1 c_2 s_3 & c_1 s_2 & c_1 c_2 c_3 - s_1 s_3 \end{bmatrix}$	$Y_1 X_2 Z_3 = \begin{bmatrix} c_1 c_3 + s_1 s_2 s_3 & c_3 s_1 s_2 - c_1 s_3 & c_2 s_1 \\ c_2 s_3 & c_2 c_3 & -s_2 \\ c_1 s_2 s_3 - c_3 s_1 & c_1 c_3 s_2 + s_1 s_3 & c_1 c_2 \end{bmatrix}$
$Y_1 Z_2 Y_3 = \begin{bmatrix} c_1 c_2 c_3 - s_1 s_3 & -c_1 s_2 & c_3 s_1 + c_1 c_2 s_3 \\ c_3 s_2 & c_2 & s_2 s_3 \\ -c_1 s_3 - c_2 c_3 s_1 & s_1 s_2 & c_1 c_3 - c_2 s_1 s_3 \end{bmatrix}$	$Y_1 Z_2 X_3 = \begin{bmatrix} c_1 c_2 & s_1 s_3 - c_1 c_3 s_2 & c_3 s_1 + c_1 s_2 s_3 \\ s_2 & c_2 c_3 & -c_2 s_3 \\ -c_2 s_1 & c_1 s_3 + c_3 s_1 s_2 & c_1 c_3 - s_1 s_2 s_3 \end{bmatrix}$
$Z_1 Y_2 Z_3 = \begin{bmatrix} c_1 c_2 c_3 - s_1 s_3 & -c_3 s_1 - c_1 c_2 s_3 & c_1 s_2 \\ c_1 s_3 + c_2 c_3 s_1 & c_1 c_3 - c_2 s_1 s_3 & s_1 s_2 \\ -c_3 s_2 & s_2 s_3 & c_2 \end{bmatrix}$	$Z_1 Y_2 X_3 = \begin{bmatrix} c_1 c_2 & c_1 s_2 s_3 - c_3 s_1 & s_1 s_3 + c_1 c_3 s_2 \\ c_2 s_1 & c_1 c_3 + s_1 s_2 s_3 & c_3 s_1 s_2 - c_1 s_3 \\ -s_2 & c_2 s_3 & c_2 c_3 \end{bmatrix}$
$Z_1 X_2 Z_3 = \begin{bmatrix} c_1 c_3 - c_2 s_1 s_3 & -c_1 s_3 - c_2 c_3 s_1 & s_1 s_2 \\ c_3 s_1 + c_1 c_2 s_3 & c_1 c_2 c_3 - s_1 s_3 & -c_1 s_2 \\ s_2 s_3 & c_3 s_2 & c_2 \end{bmatrix}$	$Z_1 X_2 Y_3 = \begin{bmatrix} c_1 c_3 - s_1 s_2 s_3 & -c_2 s_1 & c_1 s_3 + c_3 s_1 s_2 \\ c_3 s_1 + c_1 s_2 s_3 & c_1 c_2 & s_1 s_3 - c_1 c_3 s_2 \\ -c_2 s_3 & s_2 & c_2 c_3 \end{bmatrix}$

- Example: Z-Y-Z Euler angles:
 - Sequence of three rotations about body-fixed axes

$$- \mathbf{R} = \mathbf{R}_{z}(\phi) \cdot \mathbf{R}_{y}(\theta) \cdot \mathbf{R}_{z}(\psi)$$

$$-\mathbf{R} = \begin{bmatrix} c\phi c\theta c\psi - s\phi s\psi & -c\phi c\theta s\psi - s\phi c\psi & c\phi s\theta \\ s\phi c\theta c\psi + c\phi s\psi & -s\phi c\theta s\psi + c\phi c\psi & s\phi c\theta \\ -s\theta c\psi & s\theta s\psi & c\theta \end{bmatrix} = \begin{bmatrix} r_{11} & r_{12} & r_{13} \\ r_{21} & r_{22} & r_{23} \\ r_{31} & r_{32} & r_{33} \end{bmatrix}$$

• If $\sin \theta \neq 0$:

$$-\theta = acos(r_{33})$$

$$-\psi = \operatorname{atan} 2(\frac{r_{32}}{\sin \theta}, -\frac{r_{31}}{\sin \theta})$$

$$-\phi = \operatorname{atan} 2(\frac{r_{23}}{\sin \theta}, \frac{r_{13}}{\sin \theta})$$

- Example: Z-Y-Z Euler angles:
 - Sequence of three rotations about body-fixed axes

$$- \mathbf{R} = \mathbf{R}_{z}(\phi) \cdot \mathbf{R}_{y}(\theta) \cdot \mathbf{R}_{z}(\psi)$$

$$-\mathbf{R} = \begin{bmatrix} c\phi c\theta c\psi - s\phi s\psi & -c\phi c\theta s\psi - s\phi c\psi & c\phi s\theta \\ s\phi c\theta c\psi + c\phi s\psi & -s\phi c\theta s\psi + c\phi c\psi & s\phi c\theta \\ -s\theta c\psi & s\theta s\psi & c\theta \end{bmatrix} = \begin{bmatrix} r_{11} & r_{12} & r_{13} \\ r_{21} & r_{22} & r_{23} \\ r_{31} & r_{32} & r_{33} \end{bmatrix}$$

• If $\sin \theta = 0$:

$$- \mathbf{R} = \begin{bmatrix} c\phi c\psi - s\phi s\psi & -c\phi s\psi - s\phi c\psi & 0 \\ c\phi s\psi + s\phi c\psi & -s\phi s\psi + c\phi c\psi & 0 \\ 0 & 0 & 1 \end{bmatrix} = \mathbf{R}_z(\phi + \psi)$$

- As long as $\phi + \psi$ is preserved, we have infinite set of Euler angles!

Scalar differential equation:

$$-\begin{cases} \dot{x}(t) = ax(t) \\ x(0) = x_0 \end{cases} \Rightarrow x(t) = e^{at}x_0$$

Matrix differential equation:

$$-\begin{cases} \dot{\boldsymbol{x}}(t) = A\boldsymbol{x}(t) \\ \boldsymbol{x}(0) = \boldsymbol{x}_0 \end{cases} \Rightarrow \boldsymbol{x}(t) = e^{At}\boldsymbol{x}_0$$
$$-e^{A} = \boldsymbol{I} + A + \frac{1}{2}A^2 + \frac{1}{3!}A^3 + \dots + \frac{1}{n!}A^n + \dots$$

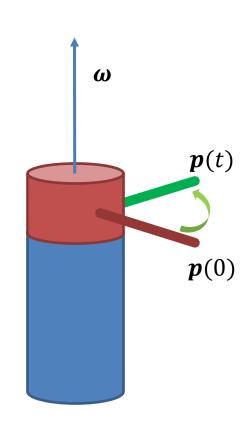

• Degree-of-freedom of SO(3):

$$- \mathbf{R} = \begin{bmatrix} r_{11} & r_{12} & r_{13} \\ r_{21} & r_{22} & r_{23} \\ r_{31} & r_{32} & r_{33} \end{bmatrix}$$

$$- \mathbf{r}_i^T \cdot \mathbf{r}_j = \begin{cases} 0 \text{ if } i \neq j \\ 1 \text{ if } i = j \end{cases} \Longrightarrow 6 \text{ constraints}$$

- R has only 3 independent parameters
- Consider the motion of a point about a unit length rotating link ω at constant unit velocity:

$$-\begin{cases} \dot{\boldsymbol{p}}(t) = \boldsymbol{\omega} \times \boldsymbol{p}(t) = \widehat{\boldsymbol{\omega}} \cdot \boldsymbol{p}(t) \\ \boldsymbol{p}(0) = \boldsymbol{p}_0 \end{cases} \Longrightarrow \boldsymbol{p}(t) = e^{\widehat{\boldsymbol{\omega}}t} \boldsymbol{p}_0$$

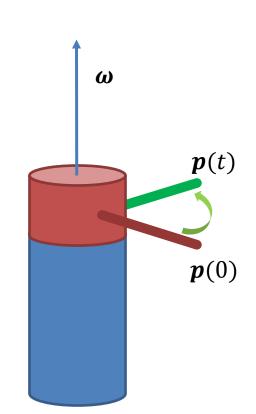

• Consider the motion of a point about a unit length rotating link ω at constant unit velocity:

$$-\begin{cases} \dot{\boldsymbol{p}}(t) = \boldsymbol{\omega} \times \boldsymbol{p}(t) = \widehat{\boldsymbol{\omega}} \cdot \boldsymbol{p}(t) \\ \boldsymbol{p}(0) = \boldsymbol{p}_0 \end{cases} \Longrightarrow \boldsymbol{p}(t) = e^{\widehat{\boldsymbol{\omega}}t} \boldsymbol{p}_0$$

$$-\widehat{\boldsymbol{\omega}} = \begin{bmatrix} 0 & -\omega_z & \omega_y \\ \omega_z & 0 & -\omega_x \\ -\omega_y & \omega_x & 0 \end{bmatrix}$$

• Rotating about ω at unit velocity for θ units:

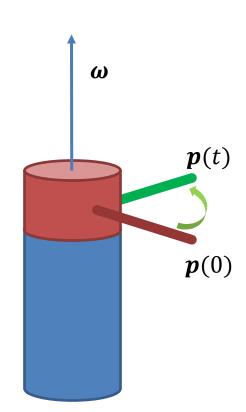

$$- \mathbf{R}(\boldsymbol{\omega}, \boldsymbol{\theta}) = e^{\widehat{\boldsymbol{\omega}}\boldsymbol{\theta}}$$

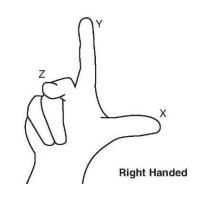

- The vector space of all 3×3 skew-symmetric matrices is denoted as so(3):
 - $so(3) = \{ \mathbf{S} \in \mathbb{R}^{3 \times 3} : \mathbf{S}^T = -\mathbf{S} \}$
- The exponential map:

$$-\mathbf{R}(\boldsymbol{\omega},\theta) = e^{\widehat{\boldsymbol{\omega}}\theta} = \mathbf{I} + \widehat{\boldsymbol{\omega}}\sin\theta + \widehat{\boldsymbol{\omega}}^2(1-\cos\theta)$$

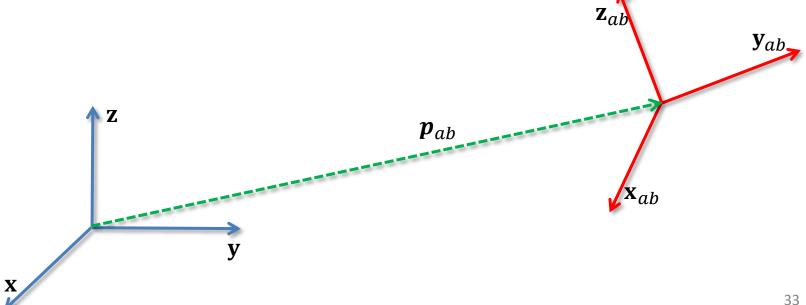

- $e^{\widehat{\omega}\theta} \in SO(3)$
 - $-\left[e^{\widehat{\boldsymbol{\omega}}\boldsymbol{\theta}}\right]^{-1} = e^{-\widehat{\boldsymbol{\omega}}\boldsymbol{\theta}} = e^{\widehat{\boldsymbol{\omega}}^T\boldsymbol{\theta}} = \left[e^{\widehat{\boldsymbol{\omega}}\boldsymbol{\theta}}\right]^T$
 - Since $\det e^0=1$, and both determinant and exponential map are continuous functions, we know $\det e^{\widehat{\omega}\theta}=1$
- The exponential map is onto (many to one)
 - $-\theta = 0 \Rightarrow \omega$ can be chosen arbitrary

 General rigid body motions that includes both translation and rotation forms the product space of \mathbb{R}^3 and SO(3). Denoted as SE(3) – Special Euclidean group.

$$-SE(3) = \{(p, R): p \in \mathbb{R}^3, R \in SO(3)\} = \mathbb{R}^3 \times SO(3)$$

- Special Euclidean group:
 - $-SE(3) = \{(p, R): p \in \mathbb{R}^3, R \in SO(3)\} = \mathbb{R}^3 \times SO(3)$
- Transformation of a point between different coordinate frames:

Homogeneous coordinates of a point:

$$-\,\,oldsymbol{ar{p}} = egin{bmatrix} p_x \ p_y \ p_z \ 1 \end{bmatrix}$$

Homogeneous coordinates of a vector:

$$-\ \overline{oldsymbol{v}} = egin{bmatrix} v_x \ v_y \ v_z \ 0 \end{bmatrix}$$

Homogeneous representation of rigid body motion:

$$- \ \overline{\boldsymbol{p}}^{a} = \begin{bmatrix} \boldsymbol{p}^{a} \\ 1 \end{bmatrix} = \begin{bmatrix} \boldsymbol{R}_{ab} & \boldsymbol{p}_{ab} \\ 0 & 1 \end{bmatrix} \begin{bmatrix} \boldsymbol{p}^{b} \\ 1 \end{bmatrix} = \bar{g}_{ab} \overline{\boldsymbol{p}}^{b}$$

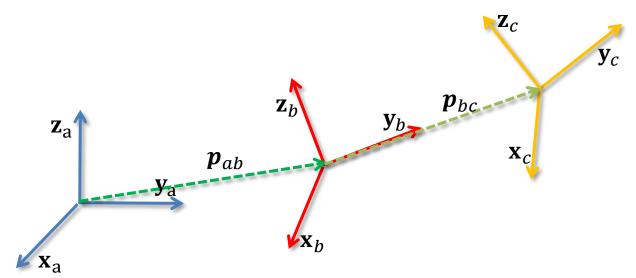

Homogeneous representation of rigid body motion:

$$- \bar{g}_{ab} = \begin{bmatrix} \mathbf{R}_{ab} & \mathbf{p}_{ab} \\ 0 & 1 \end{bmatrix}$$

Composition rule for rigid body motions:

$$- \bar{g}_{ac} = \bar{g}_{ab} \cdot \bar{g}_{bc} = \begin{bmatrix} \mathbf{R}_{ab} \mathbf{R}_{bc} & \mathbf{R}_{ab} \mathbf{p}_{bc} + \mathbf{p}_{ab} \\ 0 & 1 \end{bmatrix}$$

Compare with composition of rotational motion: $\mathbf{R}_{ac} = \mathbf{R}_{ab} \cdot \mathbf{R}_{bc}$

Properties of Rigid Body Motion

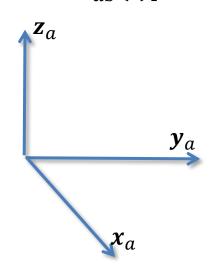

- $SE(3) = \{(p, R): p \in \mathbb{R}^3, R \in SO(3)\} = \mathbb{R}^3 \times SO(3)$
- SE(3) is a group under the operation of matrix multiplication
 - Closure
 - Identity
 - Inverse
 - Associativity
- $g \in SE(3)$ is a rigid body transformation
 - Lengths are preserved
 - Cross products are preserved

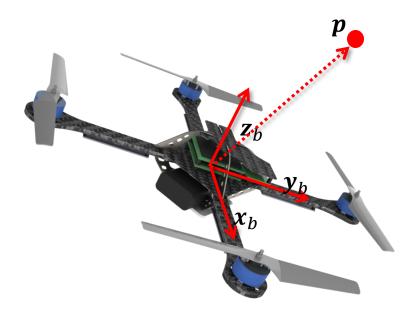

Prove it yourself!

Rigid Body Velocities

- Coordinate frames:
 - Frame A: spatial frame
 - Frame B: body frame
- A point attached to the body follows a rotational path in spatial frame:

$$- \boldsymbol{p}^{a}(t) = \boldsymbol{R}_{ab}(t)\boldsymbol{p}^{b}$$

- Coordinate frames:
 - Frame A: spatial frame
 - Frame B: body frame
- A point attached to the body follows a rotational path in spatial frame:

$$- \boldsymbol{p}^{a}(t) = \boldsymbol{R}_{ab}(t)\boldsymbol{p}^{b}$$

• The velocity of the point in spatial frame:

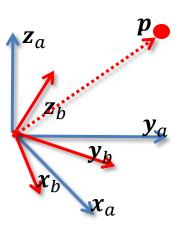

$$- \boldsymbol{v}_p^a(t) = \frac{d}{dt} \boldsymbol{p}^a(t) = \dot{\boldsymbol{R}}_{ab}(t) \boldsymbol{p}^b$$

• This can be rewritten as:

$$- \boldsymbol{v}_p^a(t) = \left(\dot{\boldsymbol{R}}_{ab}(t) \boldsymbol{R}_{ab}^{-1}(t) \boldsymbol{R}_{ab}(t) \boldsymbol{p}^b \right)$$

Skew-symmetric matrix. Why?

Prove
$$\mathbf{R}\mathbf{R}^T = \mathbf{I} \implies \dot{\mathbf{R}}\mathbf{R}^T + \mathbf{R}\dot{\mathbf{R}}^T = 0$$

• The instantaneous spatial angular velocity $oldsymbol{\omega}_{ab}^a$

$$-\widehat{\boldsymbol{\omega}}_{ab}^{a} = \dot{\boldsymbol{R}}_{ab} \cdot \boldsymbol{R}_{ab}^{-1}$$

• The instantaneous body angular velocity $oldsymbol{\omega}_{ab}^b$

$$-\widehat{\boldsymbol{\omega}}_{ab}^{b} = \boldsymbol{R}_{ab}^{-1} \cdot \dot{\boldsymbol{R}}_{ab}$$

Conversion:

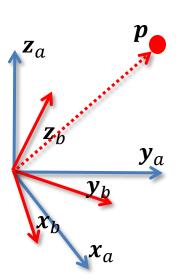

$$-\widehat{\boldsymbol{\omega}}_{ab}^{b} = \boldsymbol{R}_{ab}^{-1} \cdot \widehat{\boldsymbol{\omega}}_{ab}^{a} \cdot \boldsymbol{R}_{ab}$$

$$- \boldsymbol{\omega}_{ab}^{b} = \boldsymbol{R}_{ab}^{-1} \cdot \boldsymbol{\omega}_{ab}^{a}$$

Velocity induced by rotational motion:

$$-\boldsymbol{v}_{p}^{a}=\widehat{\boldsymbol{\omega}}_{ab}^{a}\cdot\boldsymbol{R}_{ab}\cdot\boldsymbol{p}^{b}=\boldsymbol{\omega}_{ab}^{a}\times\boldsymbol{p}^{a}$$

$$-\boldsymbol{v}_p^b = \boldsymbol{R}_{ab}^T \cdot \boldsymbol{v}_p^a = \boldsymbol{\omega}_{ab}^b \times \boldsymbol{p}^b$$

Numerical Integration

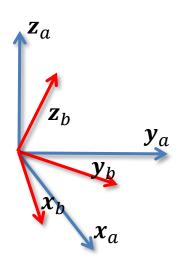

$$-\dot{\mathbf{R}} = \mathbf{R}\widehat{\boldsymbol{\omega}}^b \Rightarrow \mathbf{R}(t + \Delta t) \sim \mathbf{R}(t) + \Delta t \cdot \mathbf{R}(t)\widehat{\boldsymbol{\omega}}^b$$

$$-\dot{\mathbf{R}} = \widehat{\boldsymbol{\omega}}^a \mathbf{R} \Rightarrow \mathbf{R}(t + \Delta t) \sim \mathbf{R}(t) + \Delta t \cdot \widehat{\boldsymbol{\omega}}^a \mathbf{R}(t)$$

Constant speed rotation

$$-\mathbf{R}(t) = \mathbf{R}_0 \cdot \exp(\widehat{\boldsymbol{\omega}}_0^b \cdot t)$$

$$- \mathbf{R}(t) = \exp(\widehat{\boldsymbol{\omega}}_0^a \cdot t) \cdot \mathbf{R}_0$$

• Simple example

$$\mathbf{R} = \begin{bmatrix} \cos\theta & -\sin\theta & 0\\ \sin\theta & \cos\theta & 0\\ 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{R}^{T} = \begin{bmatrix} \cos\theta & \sin\theta & 0 \\ -\sin\theta & \cos\theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \qquad \dot{\mathbf{R}} = \begin{bmatrix} -\sin\theta & -\cos\theta & 0 \\ \cos\theta & -\sin\theta & 0 \\ 0 & 0 & 0 \end{bmatrix} \dot{\theta}$$

Simple example

$$\mathbf{R} = \begin{bmatrix} \cos\theta & -\sin\theta & 0\\ \sin\theta & \cos\theta & 0\\ 0 & 0 & 1 \end{bmatrix}$$

$$\widehat{\boldsymbol{\omega}}_{ab}^{b} = \boldsymbol{R}^{T} \dot{\boldsymbol{R}} = \begin{bmatrix} \cos\theta & \sin\theta & 0 \\ -\sin\theta & \cos\theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} -\sin\theta & -\cos\theta & 0 \\ \cos\theta & -\sin\theta & 0 \\ 0 & 0 & 0 \end{bmatrix} \dot{\boldsymbol{\theta}} = \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \dot{\boldsymbol{\theta}} = \begin{bmatrix} \widehat{\boldsymbol{0}} \\ 0 \\ 1 \end{bmatrix} \dot{\boldsymbol{\theta}}$$

$$\widehat{\boldsymbol{\omega}}_{ab}^{a} = \dot{\boldsymbol{R}}\boldsymbol{R}^{T} = \dot{\boldsymbol{\theta}} \begin{bmatrix} -\sin\theta & -\cos\theta & 0 \\ \cos\theta & -\sin\theta & 0 \\ 0 & 0 & 0 \end{bmatrix} \begin{bmatrix} \cos\theta & \sin\theta & 0 \\ -\sin\theta & \cos\theta & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 0 & -1 & 0 \\ 1 & 0 & 0 \\ 0 & 0 & 0 \end{bmatrix} \dot{\boldsymbol{\theta}} = \begin{bmatrix} \widehat{\boldsymbol{0}} \\ 0 \\ 1 \end{bmatrix} \dot{\boldsymbol{\theta}}$$

Two rotations

$$R = R_{Z}(\theta) R_{X}(\varphi)$$

$$\widehat{\omega}^{b} = R^{T} \dot{R} = (R_{Z} R_{X})^{T} (\dot{R}_{Z} R_{X} + R_{Z} \dot{R}_{X})$$

$$= R_{X}^{T} R_{Z}^{T} \dot{R}_{Z} R_{X} + R_{X}^{T} \dot{R}_{X}$$

$$\widehat{\omega}^{a} = \dot{R} R^{T} = (\dot{R}_{Z} R_{X} + R_{Z} \dot{R}_{X}) (R_{Z} R_{X})^{T}$$

$$= \dot{R}_{Z} R_{Z}^{T} + R_{Z} \dot{R}_{X} R_{X}^{T} R_{Z}^{T}$$

Rigid Body Velocity

General rigid body transformation:

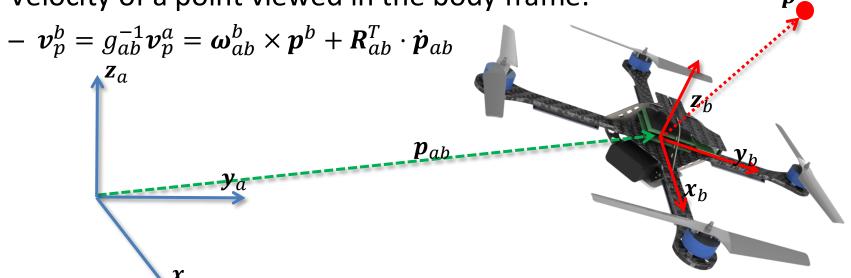

$$- g_{ab} = \begin{bmatrix} \mathbf{R}_{ab} & \mathbf{p}_{ab} \\ 0 & 1 \end{bmatrix}$$

For detailed interpretation, refer to Chapter 2.4 of "A Mathematical Introduction to Robotic Manipulation"

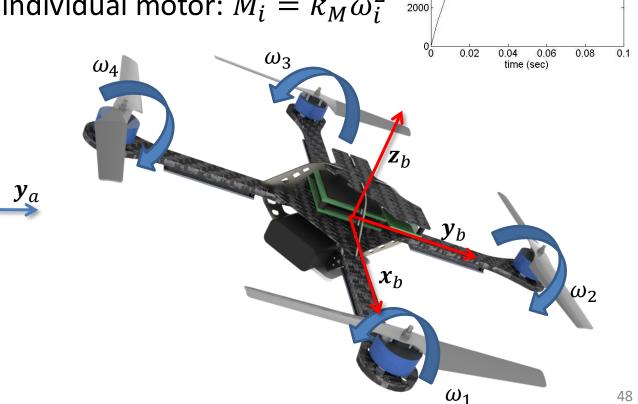

Velocity of a point viewed in the spatial frame:

$$-\boldsymbol{v}_{p}^{a} = \dot{g}_{ab}g_{ab}^{-1}\boldsymbol{p}^{a} = \boldsymbol{\omega}_{ab}^{a} \times \boldsymbol{p}^{a} - \boldsymbol{\omega}_{ab}^{a} \times \boldsymbol{p}_{ab} + \dot{\boldsymbol{p}}_{ab}$$

Velocity of a point viewed in the body frame:

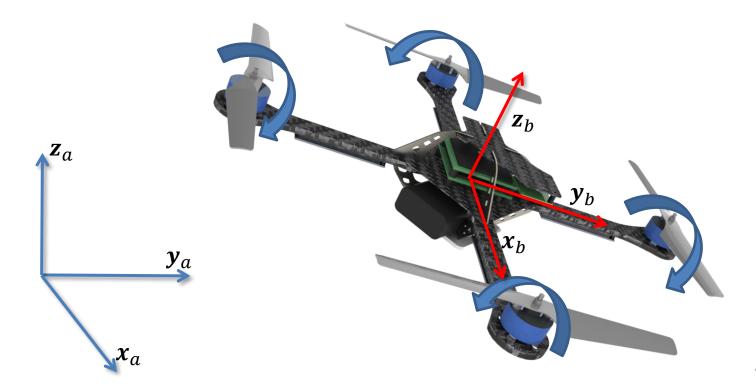

- Motor model: $\dot{\omega_i} = k_m(\omega_i^{des} \omega_i)$
- Thrust from individual motor: $F_i = k_F \omega_i^2$
- Moment from individual motor: $M_i = k_M \omega_i^2$

6000

돌 4000

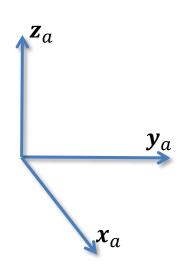

- Z-X-Y Euler Angles: $\mathbf{\textit{R}}_{ab} = \mathbf{\textit{R}}_{z}(\psi) \cdot \mathbf{\textit{R}}_{x}(\phi) \cdot \mathbf{\textit{R}}_{y}(\theta)$
- Sequence of three rotations about body-fixed axes
- What are the singularities?

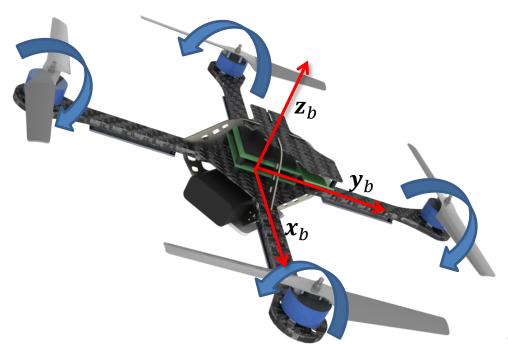

•
$$\mathbf{R}_{ab} = \begin{bmatrix} c\psi c\theta - s\phi s\psi s\theta & -c\phi s\psi & c\psi s\theta + c\theta s\phi s\psi \\ c\theta s\psi + c\psi s\phi s\theta & c\phi c\psi & s\psi s\theta - c\psi c\theta s\phi \\ -c\phi s\theta & s\phi & c\phi c\theta \end{bmatrix}$$

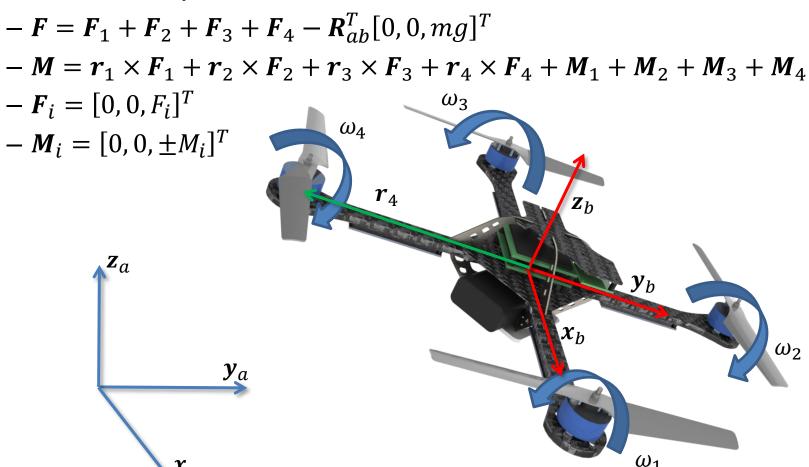

$$\bullet \begin{bmatrix} \omega_x \\ \omega_y \\ \omega_z \end{bmatrix} = \begin{bmatrix} c\theta & 0 & -c\phi s\theta \\ 0 & 1 & s\phi \\ s\theta & 0 & c\phi c\theta \end{bmatrix} \begin{bmatrix} \dot{\phi} \\ \dot{\theta} \\ \dot{\psi} \end{bmatrix}$$

Instantaneous body angular velocity.

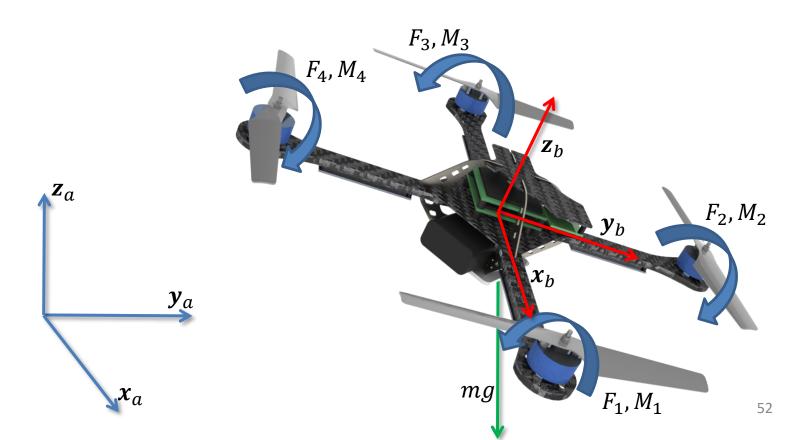

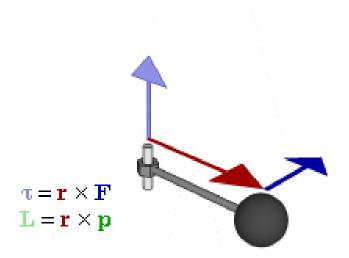

Consider body frame

• Newton Equation:
$$m\ddot{p}^a = \begin{bmatrix} 0\\0\\-mg \end{bmatrix} + R_{ab} \begin{bmatrix} 0\\0\\F_1 + F_2 + F_3 + F_4 \end{bmatrix}$$

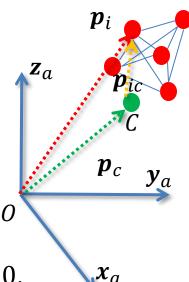

Relationship between force (F), torque/moment of force(τ), momentum (p), and angular momentum (L) vectors in a rotating system. r is the position vector.

- The rigid body as a collection of particles
 - Center of mass (CoM): p_c
 - Position of the i-th particle to CoM: $m{p}_{ic} = m{p}_i m{p}_c$
 - Velocity of the i-th particle to CoM: $m{v}_{ic} = m{\dot{p}}_i m{\dot{p}}_c$ $= m{v}_i m{v}_c$
 - Angular momentum of the i-th particle:

$$\boldsymbol{H}_i = \boldsymbol{p}_{ic} \times m_i \boldsymbol{v}_i$$

- Angular momentum of the rigid body:
 - $\boldsymbol{H} = \sum \boldsymbol{p}_{ic} \times m_i \boldsymbol{v}_i$
 - Since: $\sum m_i \boldsymbol{p}_{ic} = \sum m_i (\boldsymbol{p}_i \boldsymbol{p}_c) = \sum m_i \boldsymbol{p}_i \boldsymbol{p}_c \sum m_i = 0$,
 - We have: $\sum \boldsymbol{p}_{ic} \times m_i \boldsymbol{v}_c = (\sum m_i \boldsymbol{p}_{ic}) \times \boldsymbol{v}_c = 0$
 - Therefore: $\mathbf{H} = \sum \mathbf{p}_{ic} \times m_i \mathbf{v}_i \sum \mathbf{p}_{ic} \times m_i \mathbf{v}_c = \sum \mathbf{p}_{ic} \times m_i \mathbf{v}_{ic}$
 - Since: $v_{ic} = \boldsymbol{\omega} \times \boldsymbol{p}_{ic}$,
 - We have: $\mathbf{H} = \sum \mathbf{p}_{ic} \times (\boldsymbol{\omega} \times m_i \mathbf{p}_{ic}) = -\sum \mathbf{p}_{ic} \times (m_i \mathbf{p}_{ic} \times \boldsymbol{\omega})$

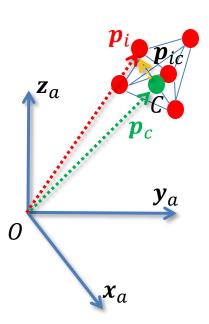

Rotational dynamics

- Angular momentum: ${m H} = \sum {m p}_{ic} imes m_i {m v}_i$
- Take the derivative: $\dot{\boldsymbol{H}} = \sum \dot{\boldsymbol{p}}_{ic} \times m_i \boldsymbol{v}_i + \sum \boldsymbol{p}_{ic} \times m_i \dot{\boldsymbol{v}}_i$
- Since $\sum \dot{\boldsymbol{p}}_{ic} \times m_i \boldsymbol{v}_i = \sum \boldsymbol{v}_i \times m_i \boldsymbol{v}_i \boldsymbol{v}_c \times m_i \boldsymbol{v}_i = \sum -\boldsymbol{v}_c \times m_i \boldsymbol{v}_i = -\boldsymbol{v}_c \times \frac{d}{dt} \sum m_i \boldsymbol{p}_i = -\boldsymbol{v}_c \times \frac{d}{dt} \boldsymbol{p}_c \sum m_i = 0$
- We have $\dot{\boldsymbol{H}} = \sum \boldsymbol{p}_{ic} \times m_i \dot{\boldsymbol{v}}_i$
- Referring to Newton's second law: ${m F}_i + \sum_{i \neq j} {m F}_{ij} = m_i \dot{{m v}}_i$

$$- \dot{\mathbf{H}} = \sum \mathbf{p}_{ic} \times m_i \dot{\mathbf{v}}_i = \sum \mathbf{p}_{ic} \times (\mathbf{F}_i + \sum_{i \neq j} \mathbf{F}_{ij}) = \sum \mathbf{p}_{ic} \times \mathbf{F}_i$$

- We also know that the external moment: $m{M} = \sum m{p}_{ic} imes m{F}_i$
- We have the rotational dynamics: $M = \dot{H}$

- Finishing the work on rotational dynamics
 - Given: $\boldsymbol{H} = -\sum \boldsymbol{p}_{ic} \times (m_i \boldsymbol{p}_{ic} \times \boldsymbol{\omega})$
 - And using the fact: $(\mathbf{R}\mathbf{a}) \times (\mathbf{R}\mathbf{b}) = \mathbf{R}(\mathbf{a} \times \mathbf{b})$
 - R: rotation matrix
 - o *a*, *b*: vectors
 - We can transform the representation of the angular momentum to the body frame with constant inertiametrix:

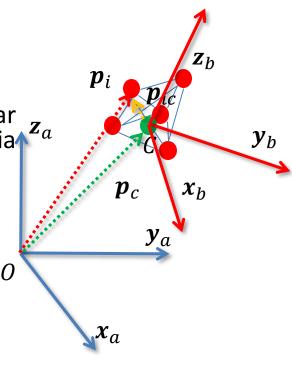

$$H = -\sum \boldsymbol{p}_{ic} \times (m_i \boldsymbol{p}_{ic} \times \boldsymbol{\omega})$$

$$= -\sum \boldsymbol{R}_{ab} \boldsymbol{p}_{ic}^b \times (m_i \boldsymbol{R}_{ab} \boldsymbol{p}_{ic}^b \times \boldsymbol{R}_{ab} \boldsymbol{\omega}^b)$$

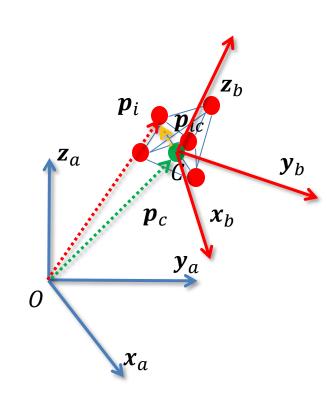

$$= -\boldsymbol{R}_{ab} \sum \boldsymbol{p}_{ic}^b \times (m_i \boldsymbol{p}_{ic}^b \times \boldsymbol{\omega}^b)$$

$$= -\boldsymbol{R}_{ab} \sum m_i \cdot \boldsymbol{p}_{ic}^b \times (\widehat{\boldsymbol{p}}_{ic}^b \cdot \boldsymbol{\omega}^b)$$

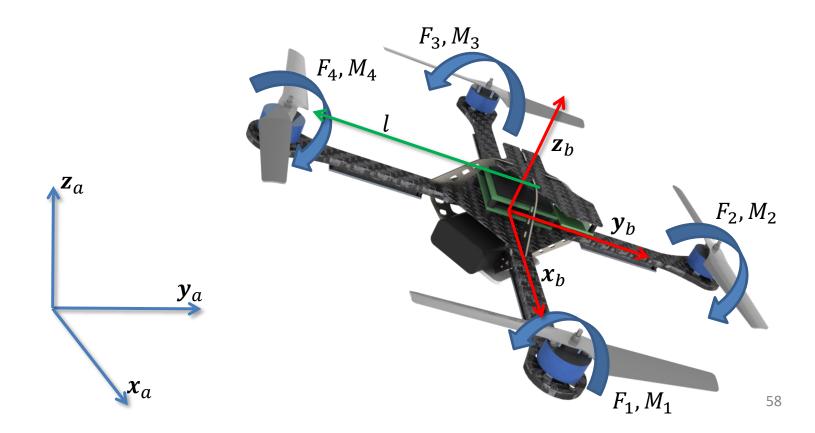

$$= \boldsymbol{R}_{ab} (-\sum m_i \cdot \widehat{\boldsymbol{p}}_{ic}^b \cdot \widehat{\boldsymbol{p}}_{ic}^b) \cdot \boldsymbol{\omega}^b = \boldsymbol{R}_{ab} (\boldsymbol{I}^b \boldsymbol{\omega}^b)$$

- Finishing the work on rotational dynamics
 - Given $\boldsymbol{H} = \boldsymbol{R}_{ab}(\boldsymbol{I}^b \boldsymbol{\omega}^b)$
 - Take the derivative: $\dot{\mathbf{H}} = \dot{\mathbf{R}}_{ab} \mathbf{I}^b \boldsymbol{\omega}^b + \mathbf{R}_{ab} \mathbf{I}^b \dot{\boldsymbol{\omega}}^b = \mathbf{R}_{ab} \widehat{\boldsymbol{\omega}}^b \mathbf{I}^b \boldsymbol{\omega}^b + \mathbf{R}_{ab} \mathbf{I}^b \dot{\boldsymbol{\omega}}^b = \mathbf{R}_{ab} (\boldsymbol{\omega}^b \times (\mathbf{I}^b \boldsymbol{\omega}^b) + \mathbf{I}^b \dot{\boldsymbol{\omega}}^b)$
 - Also transform the moment into body frame: $\mathbf{M} = \mathbf{R}_{ab}\mathbf{M}^b$
 - Finally: $\mathbf{M}^b = \boldsymbol{\omega}^b \times (\mathbf{I}^b \boldsymbol{\omega}^b) + \mathbf{I}^b \dot{\boldsymbol{\omega}}^b$

• Euler Equation:
$$I \cdot \begin{bmatrix} \dot{\omega}_x \\ \dot{\omega}_y \\ \dot{\omega}_z \end{bmatrix} + \begin{bmatrix} \omega_x \\ \omega_y \\ \omega_z \end{bmatrix} \times I \cdot \begin{bmatrix} \omega_x \\ \omega_y \\ \omega_z \end{bmatrix} = \begin{bmatrix} l(F_2 - F_4) \\ l(F_3 - F_1) \\ M_1 - M_2 + M_3 - M_4 \end{bmatrix}$$

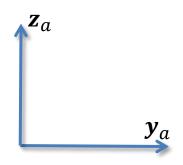

- Motor model: $\dot{\omega}_i = k_m(\omega_i^{des} \omega_i)$
- Thrust from individual motor: $F_i = k_F \omega_i^2$
- Moment from individual motor: $M_i = k_M \omega_i^2$

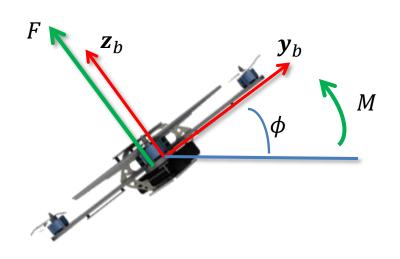

• Newton Equation:
$$m\ddot{\pmb{p}}=\begin{bmatrix}0\\0\\-mg\end{bmatrix}+\pmb{R}\begin{bmatrix}0\\0\\F_1+F_2+F_3+F_4\end{bmatrix}$$

• Euler Equation:
$$I \cdot \begin{bmatrix} \dot{\omega}_x \\ \dot{\omega}_y \\ \dot{\omega}_z \end{bmatrix} + \begin{bmatrix} \omega_x \\ \omega_y \\ \omega_z \end{bmatrix} \times I \cdot \begin{bmatrix} \omega_x \\ \omega_y \\ \omega_z \end{bmatrix} = \begin{bmatrix} l(F_2 - F_4) \\ l(F_3 - F_1) \\ M_1 - M_2 + M_3 - M_4 \end{bmatrix}$$

A Planar Quadrotor

$$\bullet \begin{bmatrix} \ddot{y} \\ \ddot{z} \\ \ddot{\phi} \end{bmatrix} = \begin{bmatrix} 0 \\ -g \\ 0 \end{bmatrix} + \begin{bmatrix} -\frac{1}{m}\sin\phi & 0 \\ \frac{1}{m}\cos\phi & 0 \\ 0 & \frac{1}{I_{\chi\chi}} \end{bmatrix} \begin{bmatrix} F \\ M \end{bmatrix}$$

Introducing Quaternion

- Rotation matrix $\mathbf{R} \in SO(3)$
 - No singularity
 - Redundant parameters
 - Kinematics: $\dot{R}=R\widehat{\omega}$, ω is the body angular rate
- ZYX Euler angle
 - Singular at roll angle of 90 degrees
 - Minimum number of parameters

$$- \text{ Kinematics: } \begin{bmatrix} \dot{\phi} \\ \dot{\theta} \\ \dot{\psi} \end{bmatrix} = \begin{bmatrix} \frac{\cos(\psi)}{\cos(\theta)} & \frac{\sin(\psi)}{\cos(\theta)} & 0 \\ -\sin(\psi) & \cos(\psi) & 0 \\ \cos(\psi)\tan(\theta) & \sin(\psi)\tan(\theta) & 1 \end{bmatrix} \begin{bmatrix} \omega_x \\ \omega_y \\ \omega_z \end{bmatrix}$$

Is there a <u>singularity free</u> parameterization that with <u>reduced</u>
 parameters? YES → quaternion

Introducing Quaternion

- Recall a rotation matrix \mathbf{R} can be decomposed as a rotation axis \mathbf{u} of angle θ by $\mathbf{R} = e^{\hat{\mathbf{u}}\theta} = \mathbf{I} + \hat{\mathbf{u}} \sin \theta + \hat{\mathbf{u}}^2 (1 \cos \theta)$
- Any vector \boldsymbol{p} , after rotation \boldsymbol{R} , is $\boldsymbol{p}' = \boldsymbol{R}\boldsymbol{p}$

$$\Rightarrow \begin{bmatrix} 0 \\ p' \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & R \end{bmatrix} \begin{bmatrix} 0 \\ p \end{bmatrix}$$
 A representation of rotation
$$\Rightarrow \begin{bmatrix} 0 \\ p' \end{bmatrix} = \begin{bmatrix} \cos \frac{\theta}{2} \\ \sin \frac{\theta}{2} u \end{bmatrix} \circ \begin{bmatrix} 0 \\ p \end{bmatrix} \circ \begin{bmatrix} \cos \frac{\theta}{2} \\ -\sin \frac{\theta}{2} u \end{bmatrix}; \forall p, u, \theta$$
A new binary operation

where

$$\begin{bmatrix} a_0 \\ a_1 \\ a_2 \\ a_3 \end{bmatrix} \circ \begin{bmatrix} b_0 \\ b_1 \\ b_2 \\ b_3 \end{bmatrix} \stackrel{\text{def}}{=} \begin{bmatrix} a_0 & -a_1 & -a_2 & -a_3 \\ a_1 & a_0 & -a_3 & a_2 \\ a_2 & a_3 & a_0 & -a_1 \\ a_3 & -a_2 & a_1 & a_0 \end{bmatrix} \begin{bmatrix} b_0 \\ b_1 \\ b_2 \\ b_3 \end{bmatrix} = \begin{bmatrix} b_0 & -b_1 & -b_2 & -b_3 \\ b_1 & b_0 & b_3 & -b_2 \\ b_2 & -b_3 & b_0 & b_1 \\ b_2 & -b_1 & b_0 \end{bmatrix} \begin{bmatrix} a_0 \\ a_1 \\ a_2 \\ a_3 \end{bmatrix}$$

Definitions of Quaternion

Quaternion

$$\boldsymbol{Q} \stackrel{\text{def}}{=} q_0 + q_1 \boldsymbol{i} + q_2 \boldsymbol{j} + q_3 \boldsymbol{k} \stackrel{\text{def}}{=} q_0 + \boldsymbol{q} \stackrel{\text{def}}{=} \begin{bmatrix} q_0 \\ \boldsymbol{q} \end{bmatrix}$$

where $i \circ i = j \circ j = k \circ k \stackrel{\text{def}}{=} -1; i \circ j \stackrel{\text{def}}{=} k; j \circ k \stackrel{\text{def}}{=} i; k \circ i \stackrel{\text{def}}{=} j$

Conjugate

$$\overline{\boldsymbol{Q}} \stackrel{\text{def}}{=} q_0 - q_1 \boldsymbol{i} - q_2 \boldsymbol{j} - q_3 \boldsymbol{k} \stackrel{\text{def}}{=} q_0 - \boldsymbol{q} \stackrel{\text{def}}{=} \begin{bmatrix} q_0 \\ -\boldsymbol{q} \end{bmatrix}$$

- Norm $\|\boldsymbol{Q}\| \stackrel{\text{def}}{=} \boldsymbol{Q} \circ \overline{\boldsymbol{Q}}$
- Inverse $Q^{-1} \stackrel{\text{def}}{=} \frac{\overline{Q}}{\|Q\|}$

Properties of Quaternion

Property 1

$$m{A} = a_0 + m{a}, \quad m{B} = b_0 + m{b}$$
 particularly $m{A} \circ m{B} = (a_0 b_0 - m{a} \cdot m{b}) + (a_0 m{b} + m{a} b_0 + m{a} imes m{b})$ $(0 + m{a}) \circ (0 + m{b}) = -m{a} \cdot m{b} + m{a} imes m{b}$

- Property 2 $(A \circ B) \circ C = A \circ (B \circ C)$
- Property 3 $\overline{A \circ B} = \overline{B} \circ \overline{A}$
- Property 4 $A = a_0 + a_1 i + a_2 j + a_3 k$ $B = b_0 + b_1 i + b_2 j + b_3 k$

Exactly what we need for representing rotations!!

$$\mathbf{A} \circ \mathbf{B} = \begin{bmatrix} a_0 & -a_1 & -a_2 & -a_3 \\ a_1 & a_0 & -a_3 & a_2 \\ a_2 & a_3 & a_0 & -a_1 \\ a_3 & -a_2 & a_1 & a_0 \end{bmatrix} \begin{bmatrix} b_0 \\ b_1 \\ b_2 \\ b_3 \end{bmatrix} = \begin{bmatrix} b_0 & -b_1 & -b_2 & -b_3 \\ b_1 & b_0 & b_3 & -b_2 \\ b_2 & -b_3 & b_0 & b_1 \\ b_3 & b_2 & -b_1 & b_0 \end{bmatrix} \begin{bmatrix} a_0 \\ a_1 \\ a_2 \\ a_3 \end{bmatrix}$$

$$\mathcal{L}(\mathbf{A})$$

Properties of Quaternion

• Product of Quaternions
$$A \circ B = \mathcal{L}(A) \begin{bmatrix} b_0 \\ h \end{bmatrix} = \mathcal{R}(B) \begin{bmatrix} a_0 \\ a \end{bmatrix}$$

$$\mathcal{L}(\mathbf{A}) = \begin{bmatrix} a_0 & -a_1 & -a_2 & -a_3 \\ a_1 & a_0 & -a_3 & a_2 \\ a_2 & a_3 & a_0 & -a_1 \\ a_3 & -a_2 & a_1 & a_0 \end{bmatrix} = \begin{bmatrix} a_0 & -\mathbf{a}^T \\ \mathbf{a} & a_0 \mathbf{I}_3 + \widehat{\mathbf{a}} \end{bmatrix}$$

$$\mathcal{R}(\mathbf{B}) = \begin{bmatrix} b_0 & -b_1 & -b_2 & -b_3 \\ b_1 & b_0 & b_3 & -b_2 \\ b_2 & -b_3 & b_0 & b_1 \\ b_3 & b_2 & -b_1 & b_0 \end{bmatrix} = \begin{bmatrix} b_0 & -\mathbf{b}^T \\ \mathbf{b} & b_0 \mathbf{I}_3 - \widehat{\mathbf{a}} \end{bmatrix}$$

Recall

$$\begin{bmatrix} 0 \\ p' \end{bmatrix} = \begin{bmatrix} \cos \frac{\theta}{2} \\ \sin \frac{\theta}{2} u \end{bmatrix} \circ \begin{bmatrix} 0 \\ p \end{bmatrix} \circ \begin{bmatrix} \cos \frac{\theta}{2} \\ -\sin \frac{\theta}{2} u \end{bmatrix}$$

$$P' \stackrel{\text{def}}{=} 0 + p'; P \stackrel{\text{def}}{=} 0 + p; \qquad Q \stackrel{\text{def}}{=} \cos \frac{\theta}{2} + \sin \frac{\theta}{2} u$$

If using quaternion Q to represent a rotation:

Basic principle:
$$P' = Q \circ P \circ \overline{Q}$$

- **P**', **P** are respectively the coordinates of the post-rotation vector and prior-rotation vector, both in the same frame.
- Q is the rotation quaternion associated with the rotation

Basic principle:
$$P' = Q \circ P \circ \overline{Q}$$

Property 1 Constant vector:
$$P^b = \overline{Q} \circ P \circ R$$

$$\mathbf{P}^b = \overline{\mathbf{Q}} \circ \mathbf{P} \circ \mathbf{R}$$

- P^b , P are respectively the coordinates in the body frame and the world frame, of the same vector
- Can be interpreted as that the vector is rotating in the opposite direction, then call the first result

Basic principle: $P' = Q \circ P \circ \overline{Q}$

Property 2 Two sequent rotations

Case 1

 ${m Q}_1$, ${m Q}_2$ are the two rotation quaternions where the rotation axes are both represented in the initial frame

Case 2

 Q_1 , Q_2 are the two rotation quaternions where the rotation axis of Q_2 is represented in the frame obtained by performing Q_1 .

$$P' = Q_1 \circ P \circ \overline{Q}_1$$

$$P'' = (\underline{Q_1 \circ Q_2 \circ \overline{Q}_1}) \circ P' \circ \overline{Q_1 \circ Q_2 \circ \overline{Q}_1} = (Q_1 \circ Q_2 \circ \overline{Q}_1) \circ Q_1 \circ P \circ \overline{Q}_1 \circ \overline{Q}_1 \circ \overline{Q}_2 \circ \overline{Q}_1 = \underline{Q_1 \circ Q_2 \circ \overline{Q}_1} = \underline{Q_1 \circ Q_2} = \underline{Q_1 \circ Q_2} = \underline{Q_1 \circ Q_2} = \underline{Q_1 \circ Q_2} = \underline{Q_1$$

Quaternion Kinematics

Recall

$$P' = Q \circ P \circ \overline{Q}$$

Taking derivative yields

$$\dot{P}' = \dot{Q} \circ P \circ \overline{Q} + Q \circ P \circ \dot{\overline{Q}}$$

$$= \dot{Q} \circ \overline{Q} \circ P' \circ Q \circ \overline{Q} + Q \circ \overline{Q} \circ P' \circ Q \circ \dot{\overline{Q}}$$

$$= \dot{Q} \circ \overline{Q} \circ P' + P' \circ Q \circ \dot{\overline{Q}}$$

As
$$\mathbf{Q} \circ \overline{\mathbf{Q}} = 1$$

Taking derivative yields

$$\dot{\boldsymbol{Q}} \circ \overline{\boldsymbol{Q}} + \boldsymbol{Q} \circ \dot{\overline{\boldsymbol{Q}}} = 0$$

rivative yields
$$oldsymbol{Q} \circ \overline{oldsymbol{Q}} = Q \circ \overline{oldsymbol{Q}} = -\dot{Q} \circ \overline{oldsymbol{Q}} \ oldsymbol{Q} \circ \overline{oldsymbol{Q}} = 0 \ oldsymbol{Q} \circ \overline{oldsymbol{Q}} = \overline{oldsymbol{Q}} \ oldsymbol{Q} \circ \overline{oldsymbol{Q}} = 0 + a; oldsymbol{Q} \circ \overline{oldsymbol{Q}} = 0 - a$$

Notice

$$\dot{\mathbf{P}}' = (0+\mathbf{a}) \circ \mathbf{P}' + \mathbf{P}' \circ (0-\mathbf{a})$$

Quaternion Kinematics

$$\dot{\mathbf{P}}' = (0+a) \circ \mathbf{P}' + \mathbf{P}' \circ (0-a)$$

$$= \begin{bmatrix} 0 \\ a \end{bmatrix} \circ \begin{bmatrix} 0 \\ p' \end{bmatrix} + \begin{bmatrix} 0 \\ p' \end{bmatrix} \circ \begin{bmatrix} 0 \\ -a \end{bmatrix}$$

$$= \begin{bmatrix} 0 \\ a \times p' \end{bmatrix} - a \cdot p' + \begin{bmatrix} 0 \\ p' \times (-a) \end{bmatrix} - p' \cdot (-a)$$

$$\begin{bmatrix} 0 \\ \dot{p}' \end{bmatrix} = \begin{bmatrix} 0 \\ 2a \times p' \end{bmatrix}$$

Recall $\dot{p}' = \omega \times p'$, ω is angular velocity vector represented in the world frame

Then
$$2\boldsymbol{a} = \boldsymbol{\omega} \Rightarrow \boldsymbol{a} = \frac{1}{2}\boldsymbol{\omega}$$

$$\Rightarrow \dot{\boldsymbol{Q}} \circ \overline{\boldsymbol{Q}} = \begin{bmatrix} 0 \\ \boldsymbol{a} \end{bmatrix} = \frac{1}{2} \begin{bmatrix} 0 \\ \boldsymbol{\omega} \end{bmatrix} \Rightarrow \dot{\boldsymbol{Q}} = \frac{1}{2} \boldsymbol{\Omega} \circ \boldsymbol{Q}$$

$$\boldsymbol{Q} = \begin{bmatrix} q_0 \\ \boldsymbol{q} \end{bmatrix} \Rightarrow \dot{\boldsymbol{Q}} = \frac{1}{2} \boldsymbol{\Omega} \circ \boldsymbol{Q} = \mathcal{L}(\boldsymbol{\Omega}) \boldsymbol{Q} = \frac{1}{2} \begin{bmatrix} 0 & -\boldsymbol{\omega}^T \\ \boldsymbol{\omega} & \widehat{\boldsymbol{\omega}} \end{bmatrix} \boldsymbol{Q}$$

Quaternion Kinematics

$$\dot{\mathbf{Q}} = \frac{1}{2}\mathbf{\Omega} \circ \mathbf{Q}$$

$$\mathbf{\Omega} = \begin{bmatrix} 0 \\ \mathbf{\Omega} \end{bmatrix}$$

 ω is angular velocity represented in the world frame

- What if ω is represented in the body frame (i.e. ω^b)?

$$\mathbf{\Omega}^b = \begin{bmatrix} 0 \\ \boldsymbol{\omega}^b \end{bmatrix}$$
 is represented in body frame

$$\Rightarrow$$
 $\mathbf{\Omega}^b = \overline{\mathbf{Q}} \circ \mathbf{\Omega} \circ \mathbf{Q}$

$$\Rightarrow \qquad \dot{\boldsymbol{Q}} = \frac{1}{2} \boldsymbol{Q} \circ \boldsymbol{\Omega}^b$$

$$\mathbf{Q} = \begin{bmatrix} q_0 \\ \mathbf{q} \end{bmatrix}$$

$$\Rightarrow \dot{\mathbf{Q}} = \frac{1}{2} \mathbf{Q} \circ \mathbf{\Omega}^b = \mathcal{R}(\mathbf{\Omega}^b) \mathbf{Q} = \frac{1}{2} \begin{bmatrix} 0 & -\boldsymbol{\omega}^{b^T} \\ \boldsymbol{\omega}^b & -\widehat{\boldsymbol{\omega}^b} \end{bmatrix} \mathbf{Q}$$

- Rotation to quaternion: $\mathbf{Q} = \begin{bmatrix} \cos \frac{\theta}{2} \\ \sin \frac{\theta}{2} \mathbf{u} \end{bmatrix}$, where $\mathbf{R} = e^{\hat{\mathbf{u}}\theta}$
- Quaternion to rotation

•
$$\mathbf{R} = \begin{bmatrix} q_0^2 + q_1^2 - q_2^2 - q_3^2 & 2(q_1q_2 - q_0q_3) & 2(q_0q_2 + q_1q_3) \\ 2(q_1q_2 + q_0q_3) & q_0^2 - q_1^2 + q_2^2 - q_3^2 & 2(-q_0q_1 + q_2q_3) \\ 2(-q_0q_2 + q_1q_3) & 2(q_0q_1 + q_2q_3) & q_0^2 - q_1^2 - q_2^2 + q_3^2 \end{bmatrix}$$

- Rotating a vector: $P' = Q \circ P \circ \overline{Q}$
- Rotating a frame: $P^b = \overline{Q} \circ P \circ Q$
- Sequential rotation (extrinsic): $\mathbf{Q} = \mathbf{Q}_n ... \circ \mathbf{Q}_2 \circ \mathbf{Q}_1$
- Sequential rotation (intrinsic): $\mathbf{Q} = \mathbf{Q}_1 \circ \mathbf{Q}_2 ... \circ \mathbf{Q}_n$
- Kinematics under spatial frame: $\dot{\boldsymbol{Q}} = \frac{1}{2} \boldsymbol{\Omega} \circ \boldsymbol{Q} = \frac{1}{2} \begin{bmatrix} 0 & -\boldsymbol{\omega}^T \\ \boldsymbol{\omega} & \widehat{\boldsymbol{\omega}} \end{bmatrix} \boldsymbol{Q}$
- Kinematics under body frame: $\dot{\boldsymbol{Q}} = \frac{1}{2} \boldsymbol{Q} \circ \boldsymbol{\Omega} = \frac{1}{2} \begin{bmatrix} 0 & -\boldsymbol{\omega}^T \\ \boldsymbol{\omega} & -\widehat{\boldsymbol{\omega}} \end{bmatrix} \boldsymbol{Q}$
